

# RESEARCH IN COMPUTING

---

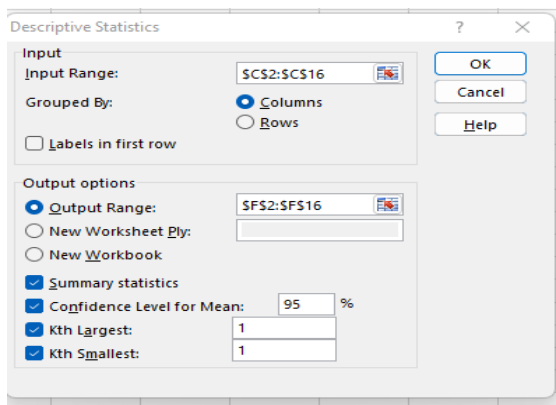

# PRACTICAL-1

**Aim: Write a program for obtaining descriptive statistics of data.**

**Step1: Program/Steps to obtain descriptive statistics of data. Using Excel Go to File Menu -> Options ->Add-Ins -> Select Analysis Tool Pak -> Press OK**

**Step2: Go to Data Menu -> Data Analysis -> Descriptive Statistics ->and Select the Age Range**

**Output:**

[illegible]

## PRACTICAL -2

**Aim: Import data from different data sources (from Excel, csv, mysql, sql server, oracle to R/Python/Excel)**

### ➤ READ DATA FROM MYSQL

- ▢ #Install Python-MySQL connector(Download from Resource folder)

Click Start> MySQL CLI> Login > Create database > create table > Insert records in table

```
mysql> Create database mydb1;
Query OK, 1 row affected (0.00 sec)

mysql> use mydb1;
Database changed
mysql> Create table test(name varchar(10), eid int);
Query OK, 0 rows affected (0.02 sec)

mysql> insert into test values('Hiten','1');
Query OK, 1 row affected (0.00 sec)

mysql> insert into test values('Sky','2');
Query OK, 1 row affected (0.02 sec)

mysql> insert into test values('Abhishek','3');
Query OK, 1 row affected (0.00 sec)

mysql> insert into test values('Chiku','4');
Query OK, 1 row affected (0.00 sec)

mysql> insert into test values('Rustom','5');
Query OK, 1 row affected (0.00 sec)

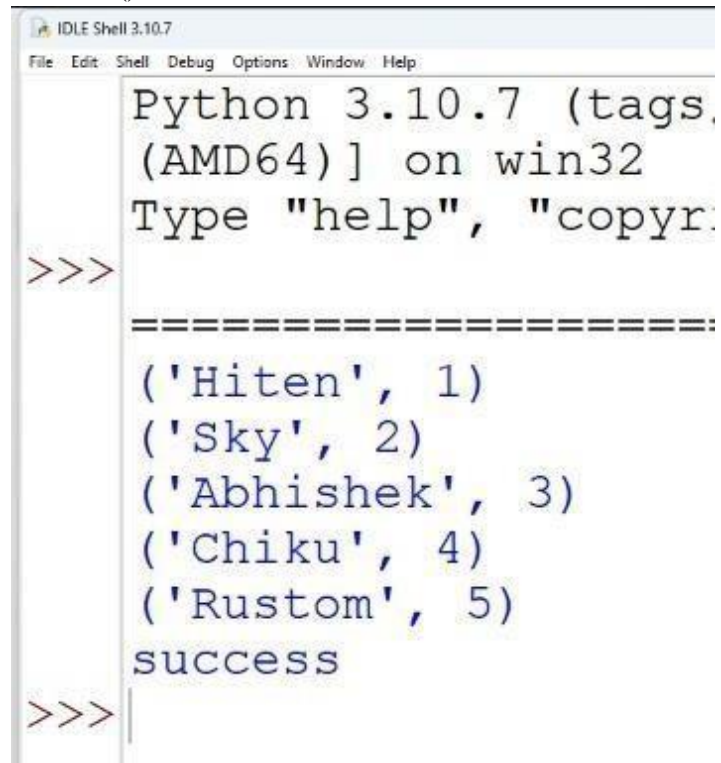

mysql> |
```

- ▢ #To install pymysql package run pip command on cmd
- ▢ #pip3 install pymysql

CODE:

```
import pymysql
db = pymysql.connect(host='localhost',user='root',password='root',database='mydb1')
cursor = db.cursor()
sql = """SELECT * from test"""
try:
    cursor.execute(sql)
    results = cursor.fetchall()
    for row in results:
        print(row)
```

```
print("success")
db.commit()
except:
    db.rollback()
db.close()
```

A screenshot of the IDLE Shell 3.10.7 window. The window has a menu bar with 'File', 'Edit', 'Shell', 'Debug', 'Options', 'Window', and 'Help'. The shell area shows the following text: 'Python 3.10.7 (tags, (AMD64)] on win32', 'Type "help", "copyr:', and a prompt '>>>'. Below the prompt, there is a line of equals signs '====='. Then, five lines of tuples are displayed: ('Hiten', 1), ('Sky', 2), ('Abhishek', 3), ('Chiku', 4), and ('Rustom', 5). Below these, the word 'success' is printed. Finally, another prompt '>>>' is shown with a vertical cursor line next to it.

```
IDLE Shell 3.10.7
File Edit Shell Debug Options Window Help
Python 3.10.7 (tags, (AMD64)] on win32
Type "help", "copyr:
>>>
=====
('Hiten', 1)
('Sky', 2)
('Abhishek', 3)
('Chiku', 4)
('Rustom', 5)
success
>>>|
```

## PRACTICAL-3

**Aim: Design a survey form for a given case study, collect the primary data and analyse it**

### Case 1:

A researcher wants to conduct a Survey in colleges on Use of ICT in higher education from Mumbai, Thane and Navi Mumbai. The survey focuses on access to and use of ICT in teaching and learning, as well as on attitudes towards the use of ICT in teaching and learning. Design questionnaire addressed to teachers seeks information about the target class, his experience using ICT for teaching, access to ICT infrastructure, support available, ICT based activities and material used, obstacles to the use of ICT in teaching, learning activities with the target class, your skills and attitudes to ICT, and some personal background information. Arrange question in following groups:

1. Information about the target class you teach
2. Experience with ICT for teaching
3. ICT access for teaching
4. Support to teachers for ICT use
5. ICT based activities and material used for teaching
6. Obstacles to using ICT in teaching and learning
7. Learning activities with the target class
8. Teacher skills
9. Teacher opinions and attitudes
10. Personal background information

## Using the collected data for analysis

[illegible]

TOTAL=SUM(D38:D39)

**OUTPUT:**

## PRATICAL 4

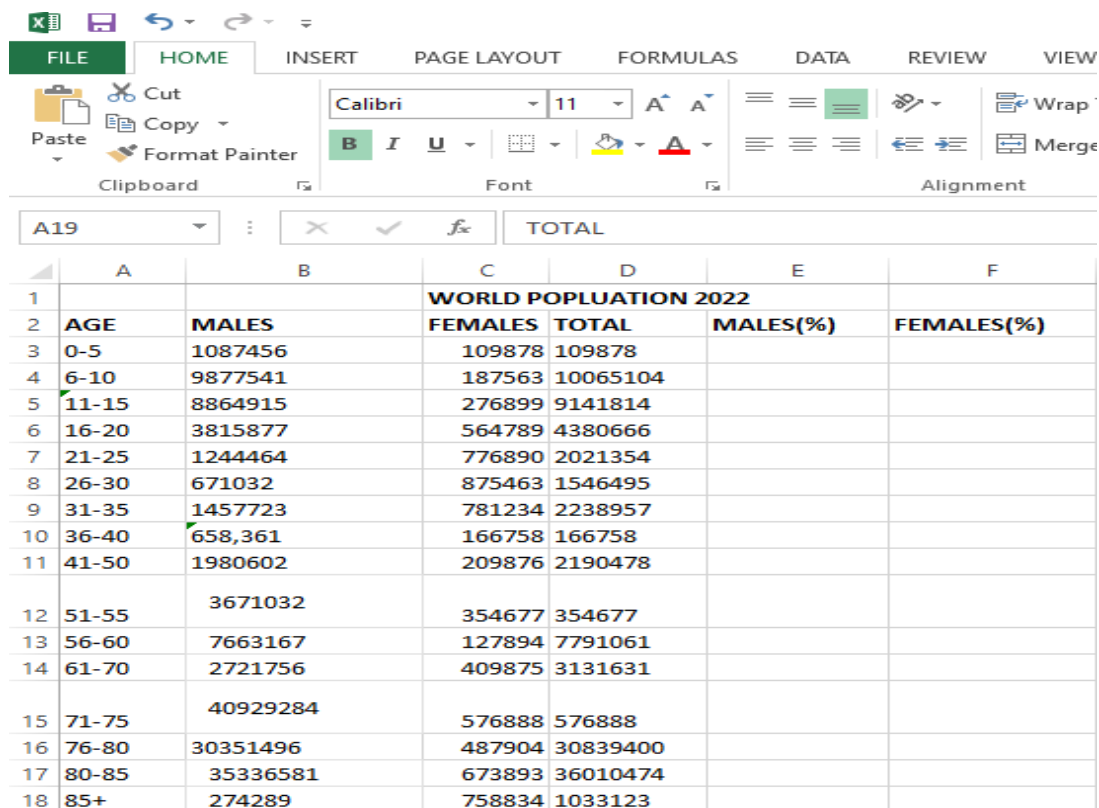

**Aim: Perform analysis of given secondary data.**

Steps in Secondary Data Analysis

1. **Determine your research question** – Knowing exactly what you are looking for.
2. **Locating data**– Knowing what is out there and whether you can gain access to it. A quick Internet search, possibly with the help of a librarian, will reveal a wealth of options.
3. **Evaluating relevance of the data** – Considering things like the data's original purpose, when it was collected, population, sampling strategy/sample, data collection protocols, operationalization of concepts, questions asked, and form/shape of the data.
4. **Assessing credibility of the data** – Establishing the credentials of the original researchers, searching for full explication of methods including any problems encountered, determining how consistent the data is with data from other sources, and discovering whether the data has been used in any credible published research.
5. **Analysis** – This will generally involve a range of statistical processes. Example: Analyse the given Population Census Data for Planning and Decision Making by using the size and composition of populations

**Example:** Analyse the given Population Census Data for Planning and Decision Making by using the size and composition of populations

**Output:-**

The screenshot shows the Microsoft Excel interface with the 'HOME' tab selected. The ribbon includes options for Clipboard, Font, and Alignment. The active cell is A19, which contains the text 'TOTAL'. Below the ribbon, a table of population data is displayed. The table has columns for Age, Males, Females, Total, Males(%), and Females(%). The data is organized by age groups, with the first column (A) containing age ranges and the subsequent columns (B-F) containing population counts and percentages. The table is titled 'WORLD POPULATION 2022'.

	A	B	C	D	E	F
1			<b>WORLD POPULATION 2022</b>			
2	<b>AGE</b>	<b>MALES</b>	<b>FEMALES</b>	<b>TOTAL</b>	<b>MALES(%)</b>	<b>FEMALES(%)</b>
3	0-5	1087456	109878	109878		
4	6-10	9877541	187563	10065104		
5	11-15	8864915	276899	9141814		
6	16-20	3815877	564789	4380666		
7	21-25	1244464	776890	2021354		
8	26-30	671032	875463	1546495		
9	31-35	1457723	781234	2238957		
10	36-40	658,361	166758	166758		
11	41-50	1980602	209876	2190478		
12	51-55	3671032	354677	354677		
13	56-60	7663167	127894	7791061		
14	61-70	2721756	409875	3131631		
15	71-75	40929284	576888	576888		
16	76-80	30351496	487904	30839400		
17	80-85	35336581	673893	36010474		
18	85+	274289	758834	1033123		

Put the cursor in cell **B19** and click on the **AutoSum** and then click **Enter**. This will calculate the total population. Then copy the formula in cell **D19** across the row **19. (Total\_population)**  
To calculate the percent of males in cell **E3**, enter the formula

[ -1\*100\*Male\_count\*Total\_population]  
=-1\*100\*B3/\$D\$19

And copy the formula in cell **E3** down to cell **E18**.  
To calculate the percent of females in cell **F3**, enter the formula

[ 1\*100\*Female\_count\*Total\_population]  
=100\*C3/\$D\$19. Copy the formula in cell **F3** down to cell **F18**.  
**This gives percentage in +ve for female and -ve for male.**

To build the population pyramid, we need to choose a horizontal bar chart with two series of data (% male and % female) and the age labels in column A as the **Category X-axis** labels. Highlight the range **A2:A18**, hold down the CTRL key and highlight the range **E2:F19**

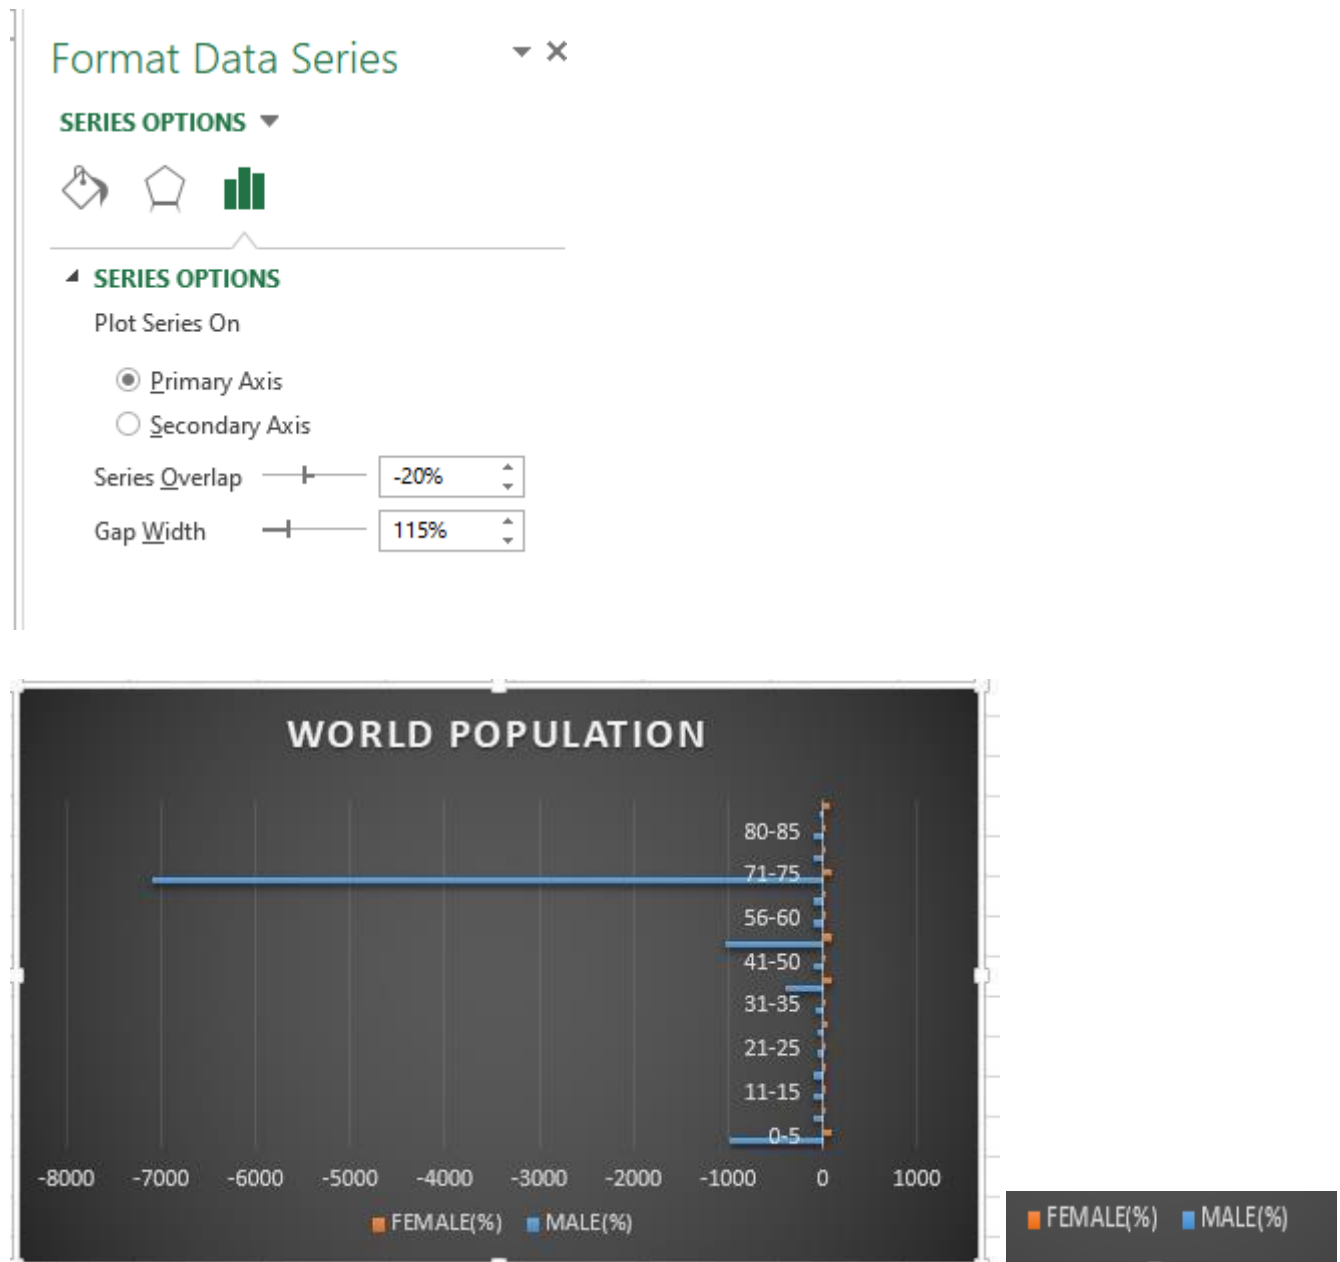

K10		:	✕	✓	<i>f<sub>x</sub></i>

19	TOTAL	104259443	7339315	111598758	-10465.43351	648.936613	
20							

Under **inset** tab, under horizontal bar charts select **clustered bar chart**.

Put the tip of your mouse arrow on the **Y-axis** (vertical axis) so it says “Category Axis”, right click and chose **Format Axis**

Choose **Axis options** tab and set the major and minor tick mark type to **None**, Axis labels to **Low**, and click **OK**.

Click on any of the bars in your pyramid, click right and select “format data series”. Set the **Overlap** to **100** and **Gap Width** to **0**. Click **OK**.

## PRATICAL 5

**Aim: Perform testing of hypothesis using one sample t-test.**

One sample t-test : The One Sample t Test determines whether the sample mean is statistically different from a known or hypothesised population mean. The One Sample t Test is a parametric test.

**H0: Mean age of given sample is 30.**

**H1: Mean age of given sample is not 30**

**#pip3 install scipy**

**#pip3 install numpy**

```
from scipy.stats import ttest_1samp
```

```
import numpy as np
```

```
ages = np.genfromtxt('ages.csv')
```

```
print(ages)
```

```
ages_mean = np.mean(ages)
```

```
print("Mean age:", ages_mean)
```

```
print("Test 1: m=30")
```

```
tset, pval = ttest_1samp(ages, 30)
```

```
print('p-values - ', pval)
```

```
if pval < 0.05:
```

```
    print("we reject null hypothesis")
```

```
else:
```

```
    print("we fail to reject null hypothesis")
```

**OUTPUT:**

```
===== RESTART: C:\Mansi\RIC PRACTICAL 5.PY =====  
[20. 30. 25. 13. 16. 17. 34. 35. 38. 43. 45. 48. 49. 50. 51. 54. 55. 56.  
 59. 61. 62. 18. 22. 29.]  
Mean age: 38.75  
Test 1: m=30  
p-values - 0.01333239479255858  
we reject null hypothesis
```

## #TEST 2

**H0: Mean age of given sample is 38.**

**H1: Mean age of given sample is not**

```
38. from scipy.stats import ttest_1samp
import numpy as np
ages = np.genfromtxt('ages.csv')
print(ages)
ages_mean = np.mean(ages)
print("Mean age:", ages_mean)
print("Test 2: m=38")
tset, pval = ttest_1samp(ages, 38)
print('p-values - ', pval)
if pval < 0.05:
    print("we reject null hypothesis")
else:
    print("we fail to reject null hypothesis")
```

```
===== RESTART: C:\Mansi\RIC PRACTICAL 5.PY =====
[20. 30. 25. 13. 16. 17. 34. 35. 38. 43. 45. 48. 49. 50. 51. 54. 55. 56.

we fail to reject null hypothesis
```

---

## OUTPUT

## Practical 6

**Aim: Write a program for t-test comparing two means for independent samples.**

The  $t$  distribution provides a good way to perform one sample tests on the mean when the population variance is not known provided the population is normal or the sample is sufficiently large so that the Central Limit Theorem applies.

### Two Sample t Test

**Example:** A college Principal informed classroom teachers that some of their students showed unusual potential for intellectual gains. One months later the students identified to teachers as having potential for unusual intellectual gains showed significantly greater gains performance on a test said to measure IQ than did students who were not so identified. Below are the data for the students:

	A	B	C
1	Experiment	Comaparison	
2	35	2	
3	40	27	
4	12	38	
5	15	31	
6	21	1	
7	14	19	
8	46	1	
9	10	34	
10	28	3	
11	48	1	
12	16	2	
13	30	3	
14	32	2	
15	48	1	
16	31	2	
17	22	1	
18	12	3	
19	39	29	
20	19	37	
21	25	2	
22	27.15	11.95	Mean
23	12.50799744	14.24245414	SD

### Experimental Data

To calculate Standard Mean go to cell A22 and type =SUM(A2:A21)/20

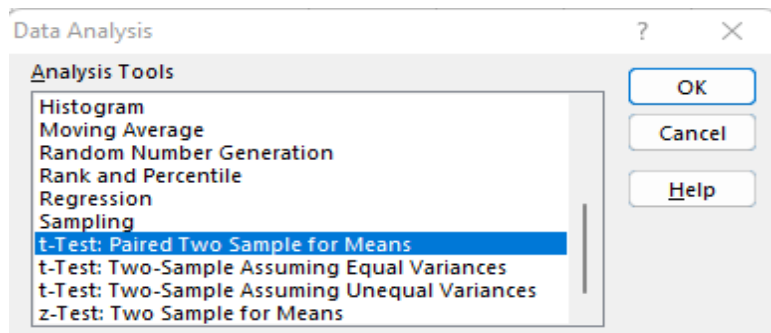

To calculate Standard Deviation go to cell A23 and type =STDEV(A2:A21)

Comparison Data

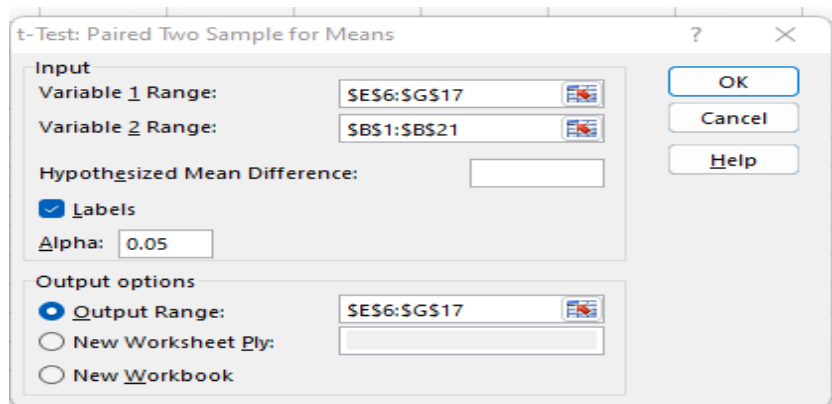

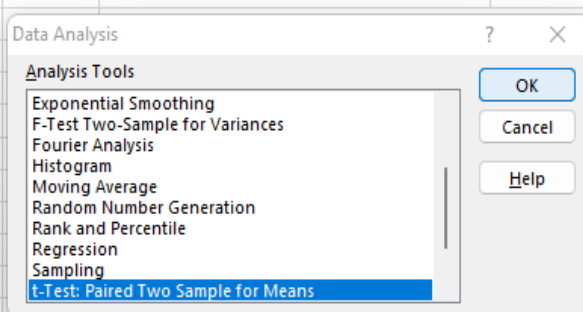

To calculate Standard Mean go to cell B22 and type =SUM(B2:B21)/20

To calculate Standard Deviation go to cell B23 and type =STDEV(B2:B21)

To find T-Test Statistics go to data Data Analysis

	A	B	C	D	E	F
1	Experiment	Comaparison				
2	35	2				
3	40	27				
4	12	38				
5	15	31				
6	21	1				
7	14	19				
8	46	1				
9	10	34				
10	28	3				
11	48	1				
12	16	2				
13	30	3				
14	32	2				
15	48	1				
16	31	2				
17	22	1				
18	12	3				
19	39	29				
20	19	37				
21	25	2				

To calculate the T-Test square value go to cell E20 and type

$$=(A22-B22)/\text{SQRT}((A23*B23)/\text{COUNT}(A2:A21)+(B23*B23)/\text{COUNT}(A2:A21))$$

Now go to cell E20 and type

$$=\text{IF}(E20<E12, \text{"H0 is Accepted"}, \text{"H0 is Rejected and H1 is Accepted"})$$

Our calculated value is larger than the tabled value at  $\alpha = .01$ , so we reject the null hypothesis and accept the alternative hypothesis, namely, that the difference in gain scores is likely the result of the experimental treatment and not the result of chance variation.

	<i>Experiment</i>	<i>Comaparison</i>
Mean	27.15	11.95
Variance	156.45	213.5236842
Observations	20	20
Pearson Correlation	-0.395904927	
Hypothesized Mean Difference	0	
df	19	
t Stat	2.996289153	
P(T<=t) one-tail	0.003711226	
t Critical one-tail	1.729132812	
P(T<=t) two-tail	0.007422452	
t Critical two-tail	2.093024054	

## OUTPUT:

24							

## Practical 7

### Aim: Perform testing of hypothesis using paired t-test.

The paired sample t-test is also called dependent sample t-test. It's an univariate test that tests for a significant difference between 2 related variables. An example of this is if you were to collect the blood pressure for an individual before and after some treatment, condition, or time point. The data set contains blood pressure readings before and after an intervention. These are variables "bp\_before" and "bp\_after".

The hypothesis being test is:

- $H_0$  - The mean difference between sample 1 and sample 2 is equal to 0.
- $H_1$  - The mean difference between sample 1 and sample 2 is not equal to 0

```
from scipy import stats
import matplotlib.pyplot as plt
import pandas as pd
df = pd.read_csv("blood_pressure.csv")
print(df[['bp_before','bp_after']].describe())

## Practical 8

**Aim: Perform testing of hypothesis using chi-squared goodness-of-fit test.**

Problem in system administrator needs to upgrade the computers for his division. He wants to know what sort of computer system his workers prefer. He gives three choices: Windows, Mac, or Linux. Test the hypothesis or theory that an equal percentage of the population prefers each type of computer system.

### Step 1: Creation of the data.

The screenshot shows the Microsoft Excel interface with the 'HOME' tab selected. The ribbon includes options for Clipboard, Font, Alignment, and Number. The active cell is C9. The data table is as follows:

	A	B	C	D	E	F	G	H	I	J	K
1	System	O	Ei								
2	Windows	20	33.33%								
3	Mac	60	33.33%								
4	Linux	20	33.33%								
5	Total	100	100%								
6											
7											

### Step 2: Setting the value of H0 and HA

H0: The population distribution of the variable is the same as the proposed distribution

HA: The distributions are different to calculate the Chi – Square value for Windows go to cell D2 and type

**Step: 3**

To calculate the Chi – Square value for Windows go to cell D2 and type = ((B2-C2)\*(B2-C2))/C2

**Step: 4**

To calculate the Chi – Square value for Mac go to cell D3 and type = ((B3-C3)\*(B3-C3))/C3

**Step: 5**

To calculate the Chi – Square value for Mac go to cell D3 and type

= ((B4-C4)\*(B4-C4))/C4

**Step: 6**

Go to Cell D5 for and type =SUM(D2:D4) To get the table value for Chi-Square for  $\alpha = 0.05$  and dof = 2,

**Step: 7**

Go to cell D7 and type =CHIINV(0.05,2) At cell D8 type =IF(D5>D7, "H0 Accepted", "H0

Rejected"Output:

In the browser (Here, Google Chrome) type the address as **“localhost:8888”** which is **"Default"**.

In **localhost:8888** the link to the **GoogleAppEngineServlet.java** file as **GoogleAppEngine** is displayed. Click on this link. It will direct you to **“localhost:8888/GoogleAppEngine”**.

The **output text** entered in the **java** program is **displayed as the output** when clicked the link “Google App Engine”
